1 Introduction

1.1 What is MSTK?

MSTK or Mesh Toolkit is a mesh framework that allows users to represent, manipulate and query unstructured 3D arbitrary topology meshes in a general manner without the need to code their own data structures.

1.2 What MSTK is not?

MSTK is not a mesh generator - it can be used to write more easily than starting from scratch. Also, MSTK cannot answer computational questions related to the mesh (for example, is this point in the given mesh element?).

1.3 Salient Features of MSTK

MSTK is a flexible framework in that it allows a variety of underlying representations for the mesh while maintaining a common interface. It will allow users to choose from different mesh representations either at initialization (implemented) or during the program execution (not implemented) so that the optimal data structures are used for the particular algorithm. The interaction of users and applications with MSTK is through a functional interface that acts as though the mesh always contains vertices, edges, faces and regions and maintains connectivity between all these entities.

MSTK allows for the simultaneous existence of an arbitrary number of meshes. However, any entity in MSTK can belong to only one mesh at a time.

MSTK has preliminary support of distributed meshes for parallel computing.

To support numerical analysis and other applications, MSTK allows applications to attach application or field data to entities. This data may be integers, reals (doubles), integer vectors, real (double) vectors, integer tensors, real (double tensors) and pointers.

The basis for development of MSTK is laid out in the following paper:

Garimella, R. "Mesh Data Structure Selection for Mesh Generation and FEA Applications," *International Journal of Numerical Methods in Engineering*, v55 n4, pp. 441-478, 2002.

1.4 Why should I use MSTK?

MSTK offers a flexible infrastructure for representing and manipulating meshes in a distributed environment so that mesh-based application developers do not have to deal with the complexities of managing their own data structures. The functional interface of MSTK is designed to provide easy access to mesh data and allow for easy-to-read but efficient code to be written for mesh based applications. Accessing the mesh data through the functional interface allows the high level application to be unchanged even if the lower level data structures in MSTK change. MSTK supports a wide array of element types and several representations, all of which can take a new developer years to write and make robust. New users of MSTK can typically start writing their own codes to query and manipulate meshes within a few days of familiarizing themselves with MSTK. Finally, use of MSTK allows easy integration with other codes using MSTK as their mesh data framework.

2 MSTK Concepts

2.1 Unstructured mesh representation

Meshes are made up of topological entities of different dimensions. In a “traditional” 3D finite element mesh, nodes are topological entities called vertices and are topologically 0-dimensional entities, while elements are topological entities called regions and are topologically 3-dimensional entities. In general, meshes can be described using vertices (0-dimensional entities), edges (1-dimensional entities), faces (2-dimensional entities) and regions (3-dimensional entities). MSTK has multiple ways of representing meshes as shown in the below. For example, representation F1 has entities of all dimensions up to the dimension of the mesh while representation R1 has entities of the lowest and highest dimension only. Currently, the application has to choose a particular representation type when a mesh is created although it may choose different representations for different meshes in the same program. In the future, the code will be allowed to switch between different representations depending on the needs of the particular algorithm being executed at that time.

NOTE: CURRENTLY THE F1 REPRESENTATION IS THE MOST ROBUST IMPLEMENTATION SINCE IT IS MOST COMMONLY USED. THIS REPRESENTATION HAS GENERALLY BEEN STABLE FOR SEVERAL YEARS. THE REDUCED REPRESENTATIONS HAVE NOT BEEN AS HEAVILY DEBUGGED AND IT MAY HAVE SOME BUGS. IF YOU CHOOSE TO USE SOME OF THE OTHER REPRESENTATIONS PLEASE REPORT ANY PROB-

LEMS IMMEDIATELY TO `rao@lanl.gov`.

Even when using reduced representations, MSTK can provide the full set of topological adjacencies as if a full representation were being used. When necessary, entities not represented explicitly in the mesh are created on-the-fly and represented as volatile entities. Even though it is possible to take an algorithm that is written for a full representation and use it as is with a reduced representation, application developers are urged to be aware of the costs of each operation for different representations and use this information to design algorithms optimized for each representation.

2.2 Volatile mesh entities in reduced representations

As discussed above reduced representations, do not explicitly represent all types of mesh entities. For example, R1 representations do not explicitly represent edges and faces while R4 representations do explicitly represent edges only. However, whenever an implicit entity is requested from MSTK, the software creates a temporary entity so that it appears that the entity actually exists in the database. Since these entities are created-on-the-fly they are called *volatile* mesh entities. For example, if an application asked for the faces of a region in an R1 representation, MSTK will create as many volatile faces as necessary, put them in a list and return them to the calling application. Thus the application can pretend to work with a full representation (although it is not always efficient to do so).

Volatile entities are stored for a period of time in internal data structures in MSTK. Whenever there is a request for a new volatile mesh entity, the code first checks if this entity has already been created. If the volatile already exists in the database, then the entity is returned as is and if it does not, it is created. This ensures that many copies of the same entity are not created in MSTK. However, to ensure that MSTK also does not store every volatile entity forever (thereby, recreating a full representation), there is a mechanism to perform garbage cleaning on volatile entities. Periodically through the execution of the code, volatile entities that have not been used for a long time are deleted from the database freeing up valuable memory (which was the main point of using a reduced representation after all).

To ensure that garbage cleaning does not delete a volatile mesh entity that is being processed or stored by a calling application, MSTK also provides a mechanism for locking entities. One can specify an autolock mechanism for the entire mesh which means that no volatile entity will ever be deleted once it is created. On the other hand, applications may lock specific entities and unlock them when they cease to be useful.

Figure 1: Mesh representations in MSTK

2.3 Mesh entity classification

The concept of mesh entities of various dimensions is actually derived from field of B-rep geometric modeling in which a model is comprised of a hierarchy of topological entities of

Figure 2: Example mesh and model showing the classification of mesh entities on geometric model entities

different dimensions. *Classification* is the relationship of each mesh entity to the model entity it represents the whole or a part of.

To clarify further, every mesh is a discrete representation of a geometric model. This geometric model may exist in the analyst's mind, as schematic on paper or as a full model in a geometric modeling system. Encoding the relationship of the mesh to this geometric model to the extent possible provides enormous algorithmic benefits to the users of meshes.

Recognizing that one may have varying degrees of information about the geometric model in different situations, MSTK allows mesh entities to store different levels of classification information or no classification information.

Every mesh entity can store the dimension of the model entity it is on (**GEntDim**), the ID of the model entity it is on (**GEntID**) and a pointer to the model entity it is on (**GEntity**). The following picture illustrates the classification of various entities in a simple mesh.

Classification information is very useful to have for simplifying algorithms in meshing and analysis applications. For example, using classification information, one can trivially extract all nodes on the boundary and apply a different smoothing algorithm than nodes in the interior of the domain. An FEA code can apply boundary conditions on nodes and faces more easily if it has classification information.

If the application developer has nothing but the material IDs of the mesh elements, MSTK can build the classification information to the best of its ability using topological and geometric information. However, it must be noted that this procedure is not perfect and some classification information cannot be derived unambiguously. So, wherever possible, users are encouraged to generate classification information during mesh generation and supply it to MSTK.

2.4 Parallel Mesh Management

MSTK now has preliminary support for representation of distributed surface and volume meshes for supporting parallel simulations. *This is an alpha functionality and the API or behavior of some functions is subject to revision.*

Currently, the only way to distribute meshes on multiple processors is to perform a serial read on processor 0 and then distribute it to however many processors are necessary. Mesh attributes and mesh entity sets are appropriately partitioned and distributed to the different processors. Functionality to read a pre-partitioned mesh is planned for the future.

MSTK currently supports one (or no) layer of overlapped or ghost entities between processors. If a surface mesh requests a layer of ghost faces, then all lower order entities (edges and vertices) forming the ghost faces are also ghosted. Similarly, if a volume mesh requests a layer of ghost regions, all lower order entities (faces, edges and vertices) forming the ghost regions are reproduced. Entities that are owned by a processor but duplicated on another processor are called *Overlap* entities. Entities that are duplicates of overlap entities are called *Ghost* entities. The master processor ID of a ghost entity is the processor ID that its corresponding overlap entity lives on.

MSTK supports automatic updating of scalars, vectors and tensors on mesh entities of all dimensions. The application can update the attribute values on its owned entities and call MSTK to update the attribute values on ghosts on other processors.

MSTK does not yet support parallel modification of meshes.

2.5 MSTK Application Programming Interface (API)

Even though MSTK is written in C, MSTK is designed in an object oriented manner. Mesh entities, mesh attributes and entity lists are considered to be objects which have their private data and a set of operators to query and manipulate this data. Even though methods may be devised to circumvent the data hiding in MSTK, this is highly discouraged. If you think

that a particular operator is not efficient or you don't have access to some mesh data, please contact the developer for assistance.

An important feature of MSTK is its ability to provide the full set of mesh operators regardless of the representation used. When using reduced representations, entities not represented explicitly in the mesh are returned as volatile objects. However, it is possible to use most MSTK operators on such objects as well.

Currently, MSTK offers only a C API but C++ and Fortran APIs are planned for the near future.

2.6 Getting meshes in and out of MSTK

There are a few ways of getting mesh data into MSTK. The first is to prepare an MSTK file with the full connectivity of an F1 representation and to read it in using `MESH_InitFromFile`. This is typically a difficult task for many applications which only have element-node data. In such cases, one can prepare an MSTK file in the R1 file format (in which the node listing is followed by the region-node connectivity) and read it in to any of the other representations, say F1.

It is also possible to import meshes in other formats into MSTK. Some formats that MSTK can read from are the GMV format and the ExodusII format. Applications can use `MESH_ImportFromFile` to import the mesh into MSTK.

MSTK can write meshes out to different formats including GMV, STL and ExodusII and FLAG X3D. When compiled with the appropriate options and using a partitioner from an external library, MSTK can also write out a parallel X3D file.

3 MSTK Data Types

List_ptr: Handle to a List object.

Mesh_ptr: Handle to a Mesh object.

MVertex_ptr: Handle to a Mesh Vertex object (Topological Dimension 0).

MEdge_ptr: Handle to a Mesh Edge object (Topological Dimension 1).

MFace_ptr: Handle to a Mesh Face object (Topological Dimension 2).

MRegion_ptr: Handle to Mesh Region object (Topological Dimension 3).

MEntity_ptr: Handle to a generic Mesh Entity object. Any of the above types of entities can be cast as *MEntity_ptr*.

GModel_ptr: Handle to a Geometric Model object.

GEntity_ptr: Handle to a Geometric Entity object.

MAttrib_ptr: Handle to a mesh attribute.

RepType: Enumerated type describing the type of mesh representation. Can be UNKNOWN_REP, F1, F4, R1, R2, R4. See Appendix 1 for schematics of these representations. *Currently only representation types F1 and F4 are supported.*

MType: Enumerated type for mesh entity type. Can be MDELETED, MVERTEX, MEDGE, MFACE, MREGION, MUNKNOWN, MALLTYPE.

MFaceType: Enumerated type for mesh face type. Can be FDELETED, FUNKNOWN, TRI, QUAD, POLYGON.

MRegionType: Enumerated type for mesh region type. Can be RDELETED, RUNKNOWN, TET, PYRAMID, PRISM, HEX, POLYHED.

AttType: Enumerated type for attribute data. Can be INT, DOUBLE, POINTER, VECTOR or TENSOR.

4 MSTK Functional Interface

4.1 List

Unordered lists of entities in MSTK are returned as type *List_ptr* (See MSets for named entity sets). The following are the list operations available in MSTK:

***List_ptr* List_New(*int* inisize):** Create a new list with an initial size, *inisize*. If *inisize* is 0, the initial size is set to be 10.

***void* List_Delete(*List_ptr* l):** Delete a list.

***List_ptr* List_Compress(*List_ptr* l):** Compress a list (delete all the null entries created when entities are removed from the list). Doing this while an algorithm is iterating through the set can currently cause problems!! Calling **List_Compress** could change the pointer for the list due to reallocation.

***List_ptr* List_Copy(*List_ptr* l):** Return a copy of a list.

***List_ptr* List_Add(*List_ptr* l, *void* *entry):** Add an entry to the list. The entry is strictly appended to the end of the list.

***List_ptr* List_ChknAdd(*List_ptr* l, *void* *entry):** Add an entry to a list only if it is not already in the list.

***List_ptr* List_Insert(*List_ptr* l, *void* *numentry, *void* *b4entry):** Insert an entry into the list in the position before 'b4entry'.

***List_ptr* List_Inserti(*List_ptr* l, *void* *numentry, *int* i):** Insert an entry into the list at the i'th valid position and push the entries previously at the i'th and later position back.

***int* List_Rem(*List_ptr* l, *void* *entry):** Remove an entry from the list. Returns 1 if successful, 0 otherwise.

***int* List_Remi(*List_ptr* l, *int* i):** Remove the i'th valid entry in the list. Returns 1 if successful, 0 otherwise.

***int* List_RemSorted(*List_ptr* l, *void* *entry, *int* (*entry2int)(*void* *)):** Remove an entry from a list that is sorted according to some correspondence between an entry

and an integer value, e.g., **MEnt_ID(entry)** gives the ID of an entity. The mapping between the entry and the integer is given by a call to the routine **entry2int**. The list could be one from which entities have previously been removed. The routine makes use of the sorted nature of the list to locate entries in $O(\log(n))$ time where n is the size of the list. An example call to this routine is

fn = **List_RemSorted(mregionslist,region,&(MR_ID));**

int List_Replace(List_ptr l, void *entry, void *numentry): Replace 'entry' with 'numentry' in set. Returns 1 if successful, 0 otherwise.

int List_Replacei(List_ptr l, int i, void *numentry): Replace the i'th valid entry in the list with 'numentry'. Returns 1 if successful, 0 otherwise.

int List_Contains(List_ptr l, void *entry): Returns 1 if list contains the entry, 0 otherwise.

int List_Locate(List_ptr l, void *entry): Returns the positional index of the entry in the list. Returns -1 if the list does not contain the entry.

void *List_Entry(List_ptr l, int i): Return the i'th valid entry in the list. Returns a NULL pointer if the i'th valid entry could not be found.

void *List_Next_Entry(List_ptr l, int *i): Return the next valid entry in the list. This routine works like an iterator. To start iterating through the list, set the iteration index $i=0$ and call the routine to get the first entry in the set. Subsequent calls to the routine will iterate through the entries in the list. The routine will return a NULL to indicate that the end of the set is reached.

The value of the iteration index i will be modified by the routine on each call to indicate where in the list it is. This value should not be modified externally while iterating through the list. Also, no specific meaning should be derived from the iteration index by other applications since the internal implementation and interpretation of the index may change at any time.

Finally, there may be unexpected consequences if entries are removed from the list while an iterator is iterating through it using **List_Next_Entry**.

int List_Num_Entries(List_ptr l): Return the number of entries in a list.

4.2 Mesh Object

A mesh object is a set of vertices (nodes) possibly connected by other entities such as edges, faces, regions. Depending on the representation chosen and type of mesh, some or all of the entities may be explicitly stored. Full representations contain all types of entities up to the highest dimension of the mesh. For example, a full representation of a tetrahedral mesh contains vertices, edges, faces and regions. However, one type of reduced representation of this mesh may contain only vertices and regions. For a surface mesh, a full representation includes vertices, edges and faces while a reduced representation only has vertices and faces. Also, depending on the type of representation, some adjacencies (information about which entities are connected to which other entities) are stored and others are derived.

***Mesh_ptr* MESH_New(*RepType* type):** Initialize a new mesh object with the given representation type which can be F1, F2, F3, F4, F5, F6, R1, R2, R3, R4. Of these types F1, F4, R1, R2 and R4 are implemented. If the representation type is not known at the present time (e.g. before reading the mesh from a file), the representation type of UNKNOWN_REP can be specified. Note that this only initializes a mesh object, it does not create or generate a mesh which is the work of high level mesh generation routines.

***int* MESH_InitFromFile(*Mesh_ptr* mesh, const char *filename):** Initialize or read a mesh from a file in the MSTK format into the given mesh object. Returns 1 if successful, 0 otherwise. It is possible to have a an MSTK file in the R1, R2 and R4 format into a mesh initialized as type F1 or F4. This routine imports any attributes that are into the mesh.

***int* MESH_InitFromGenDesc(*Mesh_ptr* mesh, *int* nv, double (*xyz)[3], *int* nf, *int* *nfv, *int* **fvids, *int* nr, *int* *nrv, *int* **rvids, *int* *nrf, *int* ***rfvtemplate):** Initialize a mesh from a minimal description of the mesh passed into the routine. In the routine, **nv** is the number of vertices or nodes and **xyz** is the array of node coordinates. If the mesh is a surface mesh, **nf** is the number of mesh faces, **nfv** gives the number of vertices for each face, **fvids** gives the array indices of the face vertices in ccw manner (starting from 0, not 1). If the mesh is a solid mesh, **nr** specifies the number of solid elements or regions. If the mesh has only standard element types (tets, pyramids, triangular prisms and hexes), then **nrv** indicates the number of vertices of each region and **rvids** gives the array indices of the region vertices. If, on the other hand, the mesh has polyhedral elements, regions have to be described in terms of faces which are in turn described in terms of vertices. Therefore, **nrf** indicates

the number of faces for each region and **rfvtemplate** gives the array indices of the vertices for each face of the region.

int MESH_ImportFromFile(*Mesh_ptr* mesh, const char *filename, const char *format): Import a mesh data from an external file format and construct MSTK mesh. Currently the formats supported are the GMV¹ file format and the Exodus II file format. The routine imports as many attributes as it can from the input file. It also uses special attributes or keywords as data about element and node classification. For GMV files, the routine uses the “material” data to indicate region or face classification depending on the dimensionality of the mesh. If “material” data is not specified, it uses the “itetchr” attribute to assign region or face classification. It also uses the “icr” keyword describing the number of constraints on a node to interpret if the node is classified on a model region, model face, model edge or a model vertex. The “itetchr” and “icr” keywords are usually present in meshes generated by LAGRIT². For Exodus II file formats, element blocks are used to create sets of mesh regions with the name ‘matset_N’ (where N is the element block ID), sidesets are used to create sets of faces named ‘sideset_N’ and nodesets are used to create sets of vertices named ‘nodeset_N’.

int MESH_BuildClassfn(*Mesh_ptr* mesh): Build classification information for mesh entities if only partial information is present. In other words, if the only data known is the IDs of geometric model entities (“material regions”) of the highest level mesh entities (faces or regions), then this procedure will build information about the type of geometric model entities that the lower dimension entities are on. Faces will be classified as being on a model face (external or interior) or inside model region. Edges will be classified as being on a model edge, model face or in a model region. Vertices will be classified as being on a model vertex, model edge, model face or in a model region. If no classification data is associated with even the highest level entities, the procedure will assume that all the highest level entities are classified on one model entity of that dimension. If partial information is available for lower order entities, this routine will not destroy that information. The procedure also tries to detect mesh edges that should be classified on model edges based on the fact that the dihedral angle between the boundary faces connected to the edge is smaller than some tolerance.

int MESH_DelInterior(*Mesh_ptr* mesh): Delete the interior of a mesh and retain only its boundaries (including interior boundaries). For solid meshes, this results in a surface mesh (i.e., all mesh regions, and mesh faces, edges and vertices classified on

¹<http://www-xdiv.lanl.gov/XCM/gmv/GMVHome.html>

²<http://lagrit.lanl.gov>

model regions are deleted). For surface meshes, this results in curve mesh. For an edge mesh, only the end vertices are retained (unlikely to be used this way). Undefined for a vertex mesh.

void MESH_WriteToFile(Mesh_ptr mesh, const char *filename): Save a mesh to a filename. The file is created if it does not exist. It is recommended that the .mstk extension be used for MSTK mesh files. However, there is no such requirement. The routine will write out the mesh and any attributes attached to the mesh except attributes of the type POINTER.

void MESH_ExportToFile(Mesh_ptr mesh, const char *filename, const char *format, int natt, char **attnames): Export a mesh to an external file format. Currently, the formats supported are the GMV file format (format: "gmv") and X3D (format: "flag"), Exodus II file format (format: "exodusii"). In addition surface meshes may be exported to STL (format: "stl") and IBM Data Explorer (format: "dx") format. Only integer and double attributes of the mesh are exported to GMV files and no attributes are exported to X3D files.

void MESH_ExportToGMV(Mesh_ptr mesh, const char *filename, int natt, char **attnames): Export a mesh to a GMV file format.

void MESH_ExportToFLAGX3D(Mesh_ptr mesh, const char *filename, int natt, char **attnames): Export a mesh to the FLAG X3D format.

void MESH_ExportToFLAGX3D_Par(Mesh_ptr mesh, const char *filename, int natt, char **attnames, int *procids): Export a mesh to the FLAG X3D format given a partitioned mesh. The owning processor for each element is given in the array *procids*.

void MESH_ExportToExodusII(Mesh_ptr mesh, const char *filename, int natt, char **attnames): Export a mesh to a GMV file format.

void MESH_ExportToDX(Mesh_ptr mesh, const char *filename): Export a mesh to the IBM Data Explorer format (SURFACE MESHES ONLY!).

void MESH_Tet2Hex(Mesh_ptr tetmesh, Mesh_ptr *hexmesh): Convert a tet mesh to a hex mesh by splitting the tets - the quality of the resulting hex mesh is usually not very good.

void MESH_Renumber(Mesh_ptr mesh): Renumber the entities of a mesh to avoid gaps in entity IDs. Note that in the current implementation, renumbering mesh entities

can make removal of and searching for mesh entities much slower, so this must be avoided as much as possible.

***int* MESH_PartitionWithMetis(*Mesh_ptr* mesh, *int* nparts, *int* **part):** Partition a mesh with the METIS libraries. 'part' is an array that contains the partition number for each mesh face (surface meshes) or mesh region (volume meshes).

NOTE THAT MSTK HAS TO HAVE BEEN COMPILED USING THE COMMAND 'make PAR=1' AND THE CALLING APPLICATION MUST LINK WITH THE METIS LIBRARY.

***GModel_ptr* MESH_GModel(*Mesh_ptr* mesh):** Return a handle to the underlying geometric model. If there is no geometric model associated with the mesh, NULL pointer is returned.

***RepType* MESH_RepType(*Mesh_ptr* mesh):** Representation type currently being used by the mesh.

***char* *MESH_RepType(*Mesh_ptr* mesh):** Representation type currently being used by the mesh returned as a 2-character string.

***int* MESH_Num_Vertices(*Mesh_ptr* mesh):** Number of vertices in the mesh.

***int* MESH_Num_Edges(*Mesh_ptr* mesh):** Number of edges in the mesh. For reduced representations, this routine returns 0 since it is impractically expensive to count the number of edges when they do not explicitly exist. Applications must find a way to avoid using this routine for reduced representations.

***int* MESH_Num_Faces(*Mesh_ptr* mesh):** Number of faces in the mesh. For reduced representations R1 or R2, this routine counts only the faces that are explicitly represented i.e. faces not connected to any mesh region. Therefore, a value of 0 will be returned for the number of faces of a tetrahedral mesh with representation R1 or R2 but the correct number will be reported for a tetrahedral mesh in other representations. Also, the correct number will be reported for the number of faces in a surface mesh in representation R1 or R2. Therefore, this routine must be used carefully.

***int* MESH_Num_Regions(*Mesh_ptr* mesh):** Number of regions in the mesh.

***MVertex_ptr* MESH_Vertex(*Mesh_ptr* mesh, *int* i):** Return the i'th vertex in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh vertices}$.

***MEdge_ptr* MESH_Edge(*Mesh_ptr* mesh, *int* i):** Return the i'th edge in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh edges}$. Returns NULL for reduced representations.

***MFace_ptr* MESH_Face(*Mesh_ptr* mesh, *int* i):** Return the i'th face in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh faces}$. Only faces explicitly represented in the mesh are returned for reduced representation (See explanation for **MESH_Num_Faces**).

***MRegion_ptr* MESH_Region(*Mesh_ptr* mesh, *int* i):** Return the i'th region in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh region}$.

***MVertex_ptr* MESH_Next_Vertex(*Mesh_ptr* mesh, *int* *idx):** Returns the next vertex while iterating through the vertices of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. This routine is in general faster than using the routine **MESH_Vertex**.

***MEdge_ptr* MESH_Next_Edge(*Mesh_ptr* mesh, *int* *idx):** Returns the next edge while iterating through the edges of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. The routine always returns NULL for reduced representations.

***MFace_ptr* MESH_Next_Face(*Mesh_ptr* mesh, *int* *idx):** Returns the next face while iterating through the faces of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. Only faces explicitly represented in the mesh are returned for reduced representation (See explanation for **MESH_Num_Faces**).

***MRegion_ptr* MESH_Next_Region(*Mesh_ptr* mesh, *int* *idx):** Returns the next region while iterating through the regions of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works.

***MVertex_ptr* MESH_VertexFromID(*Mesh_ptr* mesh, *int* id):** Return mesh vertex with given ID if it exists; return NULL otherwise.

***MEdge_ptr* MESH_EdgeFromID(*Mesh_ptr* mesh, *int* id):** Return mesh edge with given ID if it exists; return NULL otherwise. This routine will return NULL for all reduced representations.

***MFace_ptr* MESH_FaceFromID(*Mesh_ptr* mesh, *int* i):** Return mesh face with given ID if it exists; return NULL otherwise. If faces are not explicitly represented in the mesh, it will return NULL.

***MRegion_ptr* MESH_RegionFromID(*Mesh_ptr* mesh, *int* id):** Return mesh region with given ID if it exists; return NULL otherwise.

***MEntity_ptr* MESH_EntityFromID(*Mesh_ptr* mesh, *MType* mtype, *int* id):** Return mesh entity of given type and given ID if it exists; return NULL otherwise.

***int* MESH_Num_Attribs(*Mesh_ptr* mesh):** Number of attributes associated with the mesh.

***MAttrib_ptr* MESH_Attrib(*Mesh_ptr* mesh, *int* i):** Return the i'th attribute in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh attributes}$.

***MAttrib_ptr* MESH_Next_Attrib(*Mesh_ptr* mesh, *int* *index):** Returns the next attribute while iterating through the attributes of the mesh. See the routine List_Next_Entry above for an explanation of how the iteration works.

***MAttrib_ptr* MESH_AttribByName(*Mesh_ptr* mesh, *const char* *name):** Return a mesh attribute with given name if it exists in the mesh. Returns NULL if mesh has no such attribute.

***int* MESH_Num_MSets(*Mesh_ptr* mesh):** Number of entity sets associated with the mesh.

***MSet_ptr* MESH_MSet(*Mesh_ptr* mesh, *int* i):** Return the i'th entity set in the mesh. Returns NULL if $i < 0$ or $i > \text{number of entity sets}$.

***MSet_ptr* MESH_Next_MSet(*Mesh_ptr* mesh, *int* *index):** Returns the next entity set while iterating through the sets of the mesh. See the routine List_Next_Entry above for an explanation of how the iteration works.

MSet_ptr MESH_MSetByName(Mesh_ptr mesh, const char *name): Return a mesh entity set with given name if it exists in the mesh. Returns NULL if mesh has no such set.

void MESH_Set_GModel(Mesh_ptr mesh, GModel_ptr geom): Assign a geometric model handle to the mesh.

void MESH_Add_Vertex(Mesh_ptr mesh, MVertex_ptr v): Add a vertex to the mesh. It is assumed that the vertex and its coordinates set are properly defined. Normally, one need not call this since ***MV_New*** will add the vertex to the mesh. Use this only if you know exactly what you are doing.

void MESH_Add_Edge(Mesh_ptr mesh, MEdge_ptr e): Add an edge to the mesh. It is assumed that the edge is and its topology is defined. Normally, one need not call this since ***ME_New*** will add the edge to the mesh. Use this only if you know exactly what you are doing.

void MESH_Add_Face(Mesh_ptr mesh, MFace_ptr f): Add a face to the mesh. It is assumed that the face and its topology is properly defined. Normally, one need not call this since ***MF_New*** will add the face to the mesh. Use this only if you know exactly what you are doing.

void MESH_Add_Region(Mesh_ptr mesh, MRegion_ptr r): Add a region to the mesh. It is assumed that the region and its topology is properly defined. Normally, one need not call this since ***MR_New*** will add the region to the mesh. Use this only if you know exactly what you are doing.

void MESH_Rem_Vertex(Mesh_ptr mesh, MVertex_ptr v): Remove vertex from mesh. Vertex is not deleted and must be deleted afterward separately. Normally, one need not call this since ***MV_Delete*** will remove the vertex from the mesh. Use this only if you know exactly what you are doing.

void MESH_Rem_Edge(Mesh_ptr mesh, MEdge_ptr e): Remove edge from mesh. Edge is not deleted and must be deleted afterward separately. Normally, one need not call this since ***ME_Delete*** will remove the edge from the mesh. Use this only if you know exactly what you are doing.

void* MESH_Rem_Face(*Mesh_ptr* mesh, *MFace_ptr* f):** Remove face from mesh. Face is not deleted and must be deleted afterward separately. Normally, one need not call this since ***MF_Delete will remove the face from the mesh. Use this only if you know exactly what you are doing.

void* MESH_Rem_Region(*Mesh_ptr* mesh, *MRegion_ptr* r):** Remove region from mesh. Region is not deleted and must be deleted afterward separately. Normally, one need not call this since ***MR_Delete will remove the region from the mesh. Use this only if you know exactly what you are doing.

***void* MESH_Set_AutoLock(*Mesh_ptr* mesh, *int* autolock):** If autolock is 1, all volatile mesh entities created in reduced representations will be automatically locked and cannot be removed by garbage cleaning procedures (They can still be removed by explicitly calling a delete on them). If it 0, volatile mesh entities can be deleted internally after a period of disuse.

***int* MESH_AutoLock(*Mesh_ptr* mesh):** Return the autolock status for volatile entities (See **MESH_Set_AutoLock** for details).

4.3 Mesh Vertex Object

***MVertex_ptr* MV_New(*Mesh_ptr* mesh):** Create a new vertex object. No geometric or topological information is embedded in the vertex when it is created. The vertex only knows which mesh it belongs to. The ID of the vertex is set by this function.

***void* MV_Delete(*MVertex_ptr* mvertex, *int* keep):** Delete the vertex. If **keep** is 0, the vertex is removed from the mesh and all topological and geometric information embedded in the vertex is destroyed. If **keep** is 1, the vertex is marked as type *MDELVERTEX* and removed from the mesh but the vertex is not destroyed.

NOTE: *MV_Delete* AND ITS COUNTERPARTS WILL, IN GENERAL, REMOVE AN ENTITY IN $O(\log(N))$ TIME WHERE N IS THE TOTAL NUMBER OF ENTITIES ADDED TO THE MESH SINCE THE START OF THE PROGRAM. HOWEVER, IF THE MESH ENTITIES HAVE NOT BEEN RENUMBERED (EITHER USING *MESH_RENUMBER* OR EXPLICITLY USING *MENT_SET_ID*) OR THE MESH ENTITY LISTS HAVE NOT BEEN COMPRESSED THEN THE REMOVAL TIME IS $O(1)$ WHICH IS CLEARLY MUCH SUPERIOR.

***void* MV_Restore(*MVertex_ptr* mvertex):** Restore a deleted vertex. The vertex type is restored from *MDELVERTEX* to *MVERTEX* and the vertex is added back to the mesh.

***void* MV_Set_Coords(*MVertex_ptr* mvertex, *double* *xyz):** Set the coordinates of the vertex.

***void* MV_Set_GEntity(*MVertex_ptr* mvertex, *GEntity_ptr* gent):** Set the geometric model entity on which vertex is classified.

***void* MV_Set_GEntDim(*MVertex_ptr* mvertex, *int* gdim):** Set topological dimension of model entity on which vertex is classified.

***void* MV_Set_GEntID(*MVertex_ptr* mvertex, *int* gid):** Set ID of model entity on which vertex is classified.

***void* MV_Add_AdjVertex(*MVertex_ptr* mvertex, *MVertex_ptr* adjvertex):** Add neighboring vertex, adjvertex, to adjacent vertex list of vertex, mvertex.

***void* MV_Rem_AdjVertex(*MVertex_ptr* mvertex, *MVertex_ptr* adjvertex):** Delete neighboring vertex of given vertex.

***void* MV_Set_ID(*MVertex_ptr* mvertex, *int* id):** Explicitly set ID of a vertex and overwrite the ID set by the MV_New operator. Does not check for duplication of edge IDs.

***Mesh_ptr* MV_Mesh(*MVertex_ptr* mv):** Returns the mesh that this vertex belongs to.

***int* MV_ID(*MVertex_ptr* mvertex):** Returns the ID of the vertex.

***int* MV_GEntDim(*MVertex_ptr* mvertex):** Returns the dimension of the geometric model entity that the vertex is classified on. Returns -1 if not known.

***int* MV_GEntID(*MVertex_ptr* mvertex):** Returns the ID of the geometric model entity that the vertex is classified on. Returns 0 if this information is not known.

***GEntity_ptr* MV_GEntity(*MVertex_ptr* mvertex):** Returns a pointer or handle to the geometric model entity that the vertex is classified on. Returns NULL if this information is not known.

***void* MV_Coords(*MVertex_ptr* mvertex, *double* *xyz):** Returns the coordinates of the vertex.

***int* MV_Num_AdjVertices(*MVertex_ptr* mvertex):** Returns the number of edge connected neighboring vertices of vertex. *Not efficient for all representations.*

***int* MV_Num_Edges(*MVertex_ptr* mvertex):** Returns the number of edges connected to the vertex.

***int* MV_Num_Faces(*MVertex_ptr* mvertex):** Returns the number of faces connected to the vertex.

***int* MV_Num_Regions(*MVertex_ptr* mvertex):** Returns the number of regions connected to the vertex

***List_ptr* MV_AdjVertices(*MVertex_ptr* mvertex):** List of adjacent or edge connected neighboring vertices of vertex.

***List_ptr* MV_Edges(*MVertex_ptr* mvertex):** List of edges connected to the vertex.
The list returned by this operator must be deleted by the calling application using *List_Delete*.

***List_ptr* MV_Faces(*MVertex_ptr* mvertex):** List of faces connected to the vertex.
The list returned by this operator must be deleted by the calling application using *List_Delete*.

***List_ptr* MV_Regions(*MVertex_ptr* mvertex):** List of regions connected to the vertex.
The list returned by this operator must be deleted by the calling application using *List_Delete*.

***PType* MV_PType(*MVertex_ptr* v):** Parallel entity type for vertex - can be PINTERIOR, POVERLAP or PGHOST.

***int* MV_MasterParID(*MVertex_ptr* v):**

***int* MV_GlobalID(*MVertex_ptr* v):**

The following three functions affect how mesh entities communicate and how their attributes are updated. IF YOU DON'T KNOW WHAT YOU ARE DOING WHEN YOU CALL THIS FUNCTION, YOU WILL GET WHAT YOU DESERVE.

***void* MV_Set_PType(*MVertex_ptr* v, *PType* ptype):**

***void* MV_Set_MasterParID(*MVertex_ptr* v, *int* masterparid)**

***void* MV_Set_GlobalID(*MVertex_ptr* v, *int* globalid):**

4.4 Mesh Edge Object

***MEdge_ptr* ME_New(*Mesh_ptr* mesh):** Create a new edge object. No topological information is embedded in the edge when it is created. The edge only knows which mesh it belongs to. The ID of the edge is set by this function.

***void* ME_Delete(*MEdge_ptr* medge, *int* keep):** Delete the edge. If **keep** is 0, the edge is removed from the mesh and all topological and geometric information embedded in the edge is destroyed. If **keep** is 1, the edge is marked as type *MDELEDGE* and removed from the mesh but the edge is not destroyed. Also, the vertices of this edge no longer point to this edge.

***void* ME_Restore(*MEdge_ptr* medge):** Restore a temporarily deleted edge. The edge type is restored from *MDELEDGE* to *MEDGE* and the edge is added back to the mesh. The vertices of the edge once again point back to the edge.

***void* ME_Set_GEntity(*MEdge_ptr* medge, *GEntity_ptr* gent):** Set the geometric model entity on which the edge is classified.

***void* ME_Set_GEntDim(*MEdge_ptr* medge, *int* gdim):** Set the topological dimension of model entity on which edge is classified.

***void* ME_Set_GEntID(*MEdge_ptr* medge, *int* gid):** Set ID of model entity on which edge is classified.

***void* ME_Set_GInfo_Auto(*MEdge_ptr* medge):** Derive the classification (GEntDim, GEntID) of the mesh edge automatically (if possible) from the classification of its vertices. If it is not possible to unambiguously get this information, the procedure will keep the default information. **THIS MAY GET WRONG OR INCORRECT INFORMATION WHEN THERE IS AMBIGUOUS DATA. FOR EXAMPLE, IF THE VERTICES OF A MESH EDGE ARE CLASSIFIED ON TWO DIFFERENT MODEL VERTICES, IT IS NOT POSSIBLE TO KNOW WHAT ENTITY THE MESH EDGE IS CLASSIFIED USING JUST THE VERTEX INFORMATION.**

***void* ME_Set_ID(*MEdge_ptr* medge, *int* id):** Explicitly set ID of an edge and overwrite the ID set by the ME_New function. Does not check for duplication of edge IDs.

void ME_Set_Vertex(MEdge_ptr medge, int i, MVertex_ptr vertex): Set the i'th vertex of the edge. i can be 0 or 1.

void ME_Replace_Vertex(MEdge_ptr medge, MVertex_ptr vert, MVertex_ptr nuvert): Replace i'th vertex by new vertex.

Mesh_ptr ME_Mesh(MEdge_ptr medge): Returns the mesh that this edge belongs to.

int ME_ID(MEdge_ptr medge): Returns the ID of the vertex. Returns -1 if not known.

int ME_GEntDim(MEdge_ptr medge): Returns the dimension of the geometric model entity that the vertex is classified on. Returns -1 if not known.

int ME_GEntID(MEdge_ptr medge): Returns the ID of the geometric model entity that the vertex is classified on. Returns 0 if this information is not known.

GEntity_ptr ME_GEntity(MEdge_ptr medge): Returns a pointer or handle to the geometric model entity that the vertex is classified on. Returns NULL if this information is not known.

int ME_Num_Faces(MEdge_ptr medge): Returns the number of faces connected to the edge.

int ME_Num_Regions(MEdge_ptr medge): Returns the number of regions connected to the edge.

MVertex_ptr ME_Vertex(MEdge_ptr medge, int i): Returns the i'th vertex of the edge. i=0 returns the first vertex and i=1 returns the second vertex.

MVertex_ptr ME_OppVertex(MEdge_ptr medge, MVertex_ptr ov): Return the vertex opposite to given vertex in edge.

int ME_UsesEntity(MEdge_ptr medge, MEntity_ptr mentity, int etype): Check if edge uses given lower dimension entity, *mentity*. The dimension of the entity is specified by the *etype* variable. For an edge, the only lower dimensional entity is a vertex. If the edge uses the vertex, the function returns 1; otherwise it returns 0. If any other type of entity is specified, the function returns 0.

***List_ptr* ME_Faces(*MEdge_ptr* medge):** Returns the set of faces using this edge. The list returned by this operator must be deleted by the calling application using *List_Delete*.

***List_ptr* ME_Regions(*MEdge_ptr* medge):** Returns the set of regions using this edge. The list returned by this operator must be deleted by the calling application using *List_Delete*.

***MEdge_ptr* MVs_CommonEdge(*MVertex_ptr* v1, *MVertex_ptr* v2):** Return the edge connecting vertices v1 and v2, if it exists. If such an edge does not exist, the function returns 0.

***double* ME_Len(*MEdge_ptr* e):** Return the length of the straight line connecting the two vertices of the edge.

***double* ME_LenSqr(*MEdge_ptr* e):** Return the square of the length of the straight line connecting the two vertices of the edge.

***void* ME_Vec(*MEdge_ptr* e, *double* *evec):** Return the vector going from the first vertex of the edge to the second vertex of the edge.

***int* MEs_AreSame(*MEdge_ptr* e1, *MEdge_ptr* e2):** *Applicable only to reduced representations.* Check if two edges described by only their vertices are the same. In a reduced representation, edges are temporary objects described by their end vertices. If two temporary edges are described by the same vertices, the edges are considered to be the same.

***void* ME_Lock(*MEdge_ptr* e):** Lock a volatile edge so that it cannot be deleted by garbage cleaning procedures (It can still be deleted by **ME_Delete**).

***void* ME_UnLock(*MEdge_ptr* e):** Unlock a volatile edge so that it may be deleted freely by garbage cleaning procedures.

***PType* ME_PType(*MEdge_ptr* v):** Parallel entity type for edge - can be PINTERIOR, POVERLAP or PGHOST.

int ME_MasterParID(*MEdge_ptr* v):

int ME_GlobalID(*MEdge_ptr* v):

The following three functions affect how mesh entities communicate and how their attributes are updated. IF YOU DON'T KNOW WHAT YOU ARE DOING WHEN YOU CALL THIS FUNCTION, YOU WILL GET WHAT YOU DESERVE.

void ME_Set_PType(*MEdge_ptr* v, *PType* ptype):

void ME_Set_MasterParID(*MEdge_ptr* v, *int* masterparid)

void ME_Set_GlobalID(*MEdge_ptr* v, *int* globalid):

4.5 Mesh Face Object

MFace_ptr MF_New(Mesh_ptr mesh): Create a new face object. No topological information is embedded in the face when it is created. The face only knows which mesh it belongs to. The ID of the face is set by this function.

void MF_Delete(MFace_ptr mface): Delete the face. If **keep** is 0, the face is removed from the mesh and all topological and geometric information embedded in the face is destroyed. If **keep** is 1, the face is marked as type *MDELFACE* and removed from the mesh but the face is not destroyed. Also, the vertices/edges of this face no longer point up to this face.

void MF_Restore(MFace_ptr mface): Restore a temporarily deleted face. The face type is restored from *MDELFACE* to *MFACE* and the face is added back to the mesh. The vertices/edges of the face once again point back to the face.

void MF_Set_GEntity(MFace_ptr mface, GEntity_ptr gent): Set the geometric model entity on which the face is classified.

void MF_Set_GEntDim(MFace_ptr mface, int gdim): Set the dimension of the geometric model entity on which the face is classified.

void MF_Set_GentID(MFace_ptr mface, int gid): Set the ID of the geometric model entity on which the face is classified.

void MF_Set_GInfo_Auto(MFace_ptr mface): Derive the classification (GEntDim, GEntID) of the mesh face automatically (if possible) from the classification of its vertices or edges. If it is not possible to unambiguously get this information, the procedure will keep the default information. **THIS MAY GET WRONG OR INCORRECT INFORMATION WHEN THERE IS AMBIGUOUS DATA.**

void MF_Set_ID(MFace_ptr mface, int id): Explicitly set ID of a face and overwrite the ID set by the **MF_New** operator. Does not check for duplication of face IDs.

void MF_Set_Edges(MFace_ptr mface, int n, MEdge_ptr *edges, int *dirs): Set the edges of the face along with their directions. The ordered set of edge pointers and their directions are passed in through arrays along with the number of edges. The edges are assumed to be ordered clockwise around the face. If an edge direction is

along the clockwise direction of the face then the entry in the 'dirs' array must be 1; otherwise it must be 0. This function is relevant only for full representations in MSTK.

void MF_Set_Vertices(MFace_ptr mface, int n, MVertex_ptr *verts): Set the vertices of the face. The ordered set of vertices (ccw around the face) is passed in through an array along with the number of vertices. This routine will collect/build all lower order topological information (edges, edge directions in the face) as needed by the face.

void MF_Replace_Edges(MFace_ptr mface, int nold, MEdge_ptr *oldedges, int nnu, MEdge_ptr *nuedges): Replace a set of edges in the face with another set of edges. The direction in which the new edges are to be used in the face are automatically deduced. This function is relevant only for full representations in MSTK. The old and new edge sets must be comprised of edges connected to each other and the end vertices of the new set must match the end vertices of the new set.

void MF_Replace_Edges_i(MFace_ptr mface, int nold, int i, int nnu, MEdge_ptr *nuedges): Replace the *nold* edges in the face starting with the *i*'th edge and going ccw around the face with a new set of edges. The directions in which the new edges are used in the face are automatically deduced. This function is relevant only for full representations in MSTK.

void MF_Replace_Vertex(MFace_ptr mface, MVertex_ptr mvertex, MVertex_ptr nuvertex): Replace a vertex in the face with another vertex. This function is relevant only for reduced representations in MSTK.

void MF_Replace_Vertex_i(MFace_ptr mface, int i, MVertex_ptr nuvertex): Replace the *i*'th vertex in the face with a new vertex. This function is relevant only for reduced representations in MSTK.

void MF_Insert_Vertex(MFace_ptr mface, MVertex_ptr nuvertex, MVertex_ptr b4vertex): Insert a vertex in the face before *b4vertex* w.r.t. a ccw ordering of the vertex faces.

void MF_Insert_Vertex_i(MFace_ptr mface, MVertex_ptr nuvertex, int i): Insert a new vertex before vertex *i* in the face w.r.t. a ccw ordering of vertices.

Mesh_ptr MF_Mesh(MFace_ptr mf): Returns the mesh that this mesh belongs to.

int MF_ID(MFace_ptr mface): Returns the ID of the face. Returns 0 if not known.

int MF_GEntDim(MFace_ptr mface): Returns the dimensions of the geometric model entity that the vertex is classified on. Returns -1 if not known.

int MF_GEntID(MFace_ptr mface): Returns the ID of the geometric model entity that the vertex is classified on. Returns 0 if this information is not known.

GEntity_ptr MF_GEntity(MFace_ptr mface): Returns a pointer or handle to the geometric model entity that the vertex is classified on. Returns NULL if this information is not known.

int MF_Num_Vertices(MFace_ptr mface): Returns the number of vertices of the face.

int MF_Num_Edges(MFace_ptr mface): Returns the number of edges of the face.

int MF_Num_AdjFaces(MFace_ptr mface): Returns the number of adjacent faces of a face. This operator is relevant only in planar or surface meshes, i.e., for boundary faces not connected to any regions.

List_ptr MF_Vertices(MFace_ptr mface, int dir, MVertex_ptr mvert): Return the ordered set of the vertices of the face. The vertices are ordered in ccw direction while looking down the face 'normal', if 'dir' is 1 and in the cw direction, if 'dir' is 0. If 'mvert' is specified, the vertex set is reordered so that it is the first vertex (This argument will be added soon to the function. For now, omit this argument). The behavior of this function can be illustrated using Figure 3. For the face shown in the figure, a vertex set with ccw ordering or 'dir' = 1 is V_0, V_1, V_2, V_3 and a vertex set with cw ordering or 'dir' = 0 is V_0, V_3, V_2, V_1 . A vertex set with ccw ordering starting with vertex V_2 is V_2, V_3, V_0, V_1 . **The list returned by this operator must be deleted by the calling application using *List_Delete*.**

List_ptr MF_Edges(MFace_ptr mface, int dir, MVertex_ptr mvert): Return the ordered set of edges of the face. The edges are ordered in the ccw while looking down the face 'normal' if dir is 1 and in the cw if dir is 0. If 'mvert' is specified, the edge set is reordered so that the first edge in the set contains this vertex. More precisely, if 'dir' is 1, and the first edge is 'e' used in the face in direction 'd', then **ME_Vertex(e,!d) = mvert**. With reference to Figure 3, the edges of the face in the ccw direction or 'dir' = 1 are E_0, E_1, E_2, E_3 and in the opposite dir are E_3, E_2, E_1, E_0 . If 'mvert' or the starting vertex is specified as V_2 , the edge set in ccw direction or 'dir' = 1 is E_2, E_3, E_0, E_1

Figure 3: Face definition

and in the opposite direction is E_1, E_0, E_3, E_2 . The list returned by this operator must be deleted by the calling application using *List_Delete*.

***List_ptr* MF_AdjFaces(*MFace_ptr* mface):** List of adjacent faces of a face. This operator is relevant only in planar or surface meshes, i.e., for boundary faces not connected to any regions. The list returned by this operator must be deleted by the calling application using *List_Delete*.

***int* MF_EdgeDir(*MFace_ptr* mface, *MEdge_ptr* medge):** Returns the direction in which the face uses the given edge. If the faces use the edge in the positive direction, the function returns 1; otherwise it returns 0.

***int* MF_EdgeDir_i(*MFace_ptr* mface, *int* i):** Returns the direction in which the face uses its i 'th edge. If the face uses the edge in the positive direction the function returns 1; otherwise it returns 0;

***List_ptr* MF_Regions(*MFace_ptr* mface):** Return the set of regions connected to the face. If the face is not used by any regions, the function returns NULL to indicate that the set is empty. If not the set may contain one or two regions. The list returned by this operator must be deleted by the calling application using *List_Delete*.

MRegion_ptr MF_Region(MFace_ptr mface, int side): Returns the region on the specified side of the face. The positive side of the face (side = 1) is the side towards which the face normal points. The negative side of the face (side = 0) is the opposite side.

int MF_UsesEntity(MFace_ptr mface, MEntity_ptr mentity, int type): Check if the face uses the given lower dimension entity, 'mentity'. The type of the entity is specified by the 'etype' variable. For a face, a lower dimensional entity can be a vertex or an edge. If the face uses the vertex or the edge, the function returns 1; otherwise it returns 0. If any other type of entity is specified, the function returns 0.

MFace_ptr MVs_CommonFace(int nv, MVertex_ptr *fverts): Return a face connected to all the given mesh vertices. Returns NULL if no such face exists.

MFace_ptr MEs_CommonFace(int ne, MEdge_ptr *fedges): Return a face connected to all the given mesh edges. Returns NULL if no such face exists.

int MFs_AreSame(MFace_ptr f1, MFace_ptr f2): *Applicable only to reduced representations.* Check if two faces described by vertices are equivalent. For example, a face described by vertices {1, 2, 3} is equivalent to faces described by vertices {1, 3, 2} and {3, 1, 2}.

PType MF_PType(MFace_ptr v): Parallel entity type for face - can be PINTERIOR, POVERLAP or PGHOST.

int MF_MasterParID(MFace_ptr v):

int MF_GlobalID(MFace_ptr v):

The following three functions affect how mesh entities communicate and how their attributes are updated. IF YOU DON'T KNOW WHAT YOU ARE DOING WHEN YOU CALL THIS FUNCTION, YOU WILL GET WHAT YOU DESERVE.

void MF_Set_PType(MFace_ptr v, PType ptype):

void MF_Set_MasterParID(MFace_ptr v, int masterparid)

void MF_Set_GlobalID(MFace_ptr v, int globalid):

void MF_Coords(MFace_ptr mface, int *n, double (*xyz)[3], int dir): Returns the coordinates of the face vertices in an array along with the number of vertices.

void MF_Lock(MFace_ptr f): Lock a volatile face so that it cannot be deleted by garbage cleaning procedures (It can still be deleted by **MF_Delete**).

void MF_UnLock(MFace_ptr f): Unlock a volatile face so that it may be deleted freely by garbage cleaning procedures.

4.6 Mesh Region Object

***MRegion_ptr* MR_New(*Mesh_ptr* mesh):** Create a new region object. No topological information is embedded in the region when it is created. The region only knows which mesh it belongs to. The ID of the region is set by this function.

***void* MR_Delete(*MRegion_ptr* mregion, *int* keep):** Delete the region. Deletes all topological information embedded in the region. If **keep** is 0, the region is removed from the mesh and all topological and geometric information embedded in the region is destroyed. If **keep** is 1, the region is marked as type *MDELREGION* and removed from the mesh but the region is not destroyed. Also, the vertices, edges and faces of this region no longer point up to this region.

***void* MR_Restore(*MRegion_ptr* mregion):** Restore a temporarily deleted region. The region type is restored from *MDELREGION* to *MREGION* and the region is added back to the mesh. The vertices, edges and faces of the region once again point back to the region.

***void* MR_Set_GEntity(*MRegion_ptr* mregion, *GEntity_ptr* gent):** Set the geometric model entity on which the region is classified.

***void* MR_Set_GEntDim(*MRegion_ptr* mregion, *int* gdim):** Set the dimension of the geometric model entity on which the region is classified.

***void* MR_Set_GEntID(*MRegion_ptr* mregion, *int* gid):** Set the ID of the geometric model entity on which the region is classified.

***void* MR_Set_GInfo_Auto(*MRegion_ptr* mregion):** Derive the classification (GEntDim, GEntID) of the mesh region automatically (if possible) from the classification of its vertices or faces. If it is not possible to unambiguously get this information, the procedure will keep the default information. **THIS MAY GET WRONG OR INCORRECT INFORMATION WHEN THERE IS AMBIGUOUS DATA.**

***void* MR_Set_ID(*MRegion_ptr* mregion, *int* id):** Explicitly set ID of a region and overwrite the ID set by the **MR_New** function. Does not check for duplication of region IDs.

***void* MR_Set_Faces(*MRegion_ptr* mregion, *int* nf, *MFace_ptr* *mfaces, *int* *dirs):** Set the faces of the region along with their directions. The *unordered* set of faces and

their directions are passed in through arrays along with the number of faces. If the normal of the face points out of the region, the associated direction to be passed in is 1; otherwise it is 0. This function is only relevant for full representations in MSTK.

void MR_Set_Vertices(MRegion_ptr mregion, int nv, MVertex_ptr *mvertices, int nf, int **rfv_template): Set the vertices of the region. This routine will collect/build all lower order topological information (edges, edge directions in the face) as needed by the face. For standard elements, the vertices must be ordered as indicated in Appendix A, while ***nf*** can be 0 and ***rfv_template*** can be NULL. For non-standard elements, ***nf*** is the number of faces of the polyhedron and ***rfv_template*** gives the vertices used in each face. More precisely, ***rfv_template*** has ***nfv*** pointers to integer array *i*. The first entry of each ***rfv_template[i]*** represents the number of vertices in that face and the remaining entries represent the list of vertices of the face listed so that the face defined by them points out of the region.

void MR_Replace_Face(MRegion_ptr mregion, MFace_ptr mface, MFace_ptr nuface, int dir): Replace a face of the region with another face. The direction in which the new face is used in the region must also be supplied. This function is only relevant for full representations in MSTK.

void MR_Replace_Vertex(MRegion_ptr mregion, MVertex_ptr mvertex, MVertex_ptr nuvertex): Replace a vertex of a region with another vertex. This function is relevant only for reduced representations in MSTK.

void MR_Replace_Face_i(MRegion_ptr mregion, int i, MFace_ptr mface, int dir): Replace the *i*'th face in the region with another face. The direction in which the new face is used in the region must also be supplied. This function is only relevant for full representations in MSTK.

void MR_Replace_Vertex_i(MRegion_ptr mregion, int i, MVertex_ptr mvertex): Replace the *i*'th vertex of the region with another vertex. This function is only relevant for reduced representations in MSTK.

Mesh_ptr MR_Mesh(MRegion_ptr mregion): Returns the mesh that the region belongs to.

int MR_ID(MRegion_ptr mregion): Returns the ID of the region. Returns 0 if not known.

***int* MR_GEntDim(*MRegion_ptr* mregion):** Returns the dimension of the geometric model entity the region is classified on. Always returns 3 since a mesh region can be classified only on a model region.

***int* MR_GEntID(*MRegion_ptr* mregion):** Returns the ID of the geometric model entity that the region is classified on. Returns 0 if not known.

***GEntity_ptr* MR_GEntity(*MRegion_ptr* mregion):** Returns a pointer or handle to the geometric model entity that the vertex is classified on. Returns NULL if this information is not known.

***int* MR_Num_Vertices(*MRegion_ptr* mregion):** Returns the number of vertices of a region.

***int* MR_Num_Edges(*MRegion_ptr* mregion):** Returns the number of edges of a region.

***int* MR_Num_Faces(*MRegion_ptr* mregion):** Returns the number of faces of a region.

***int* MR_Num_AdjRegions(*MRegion_ptr* mregion):** Returns the number of adjacent regions of a region, i.e., regions sharing a face with this region.

***List_ptr* MR_Vertices(*MRegion_ptr* mregion):** Returns the set of vertices of a region. For standard elements the vertices are ordered as indicated in Appendix A. For non-standard elements the set is unordered. **The list returned by this operator must be deleted by the calling application using *List_Delete*.**

***List_ptr* MR_Edges(*MRegion_ptr* mregion):** Return the unordered set of edges of a region. **The list returned by this operator must be deleted by the calling application using *List_Delete*.**

***List_ptr* MR_Faces(*MRegion_ptr* mregion):** Returns the set of faces of a region. **The list returned by this operator must be deleted by the calling application using *List_Delete*.**

***List_ptr* MR_AdjRegions(*MRegion_ptr* mregion):** Returns the set of adjacent regions of a region, i.e., regions sharing a face with this region. The set is not ordered.

***int* MR_FaceDir(*MRegion_ptr* mregion, *MFace_ptr* mface):** Returns the direction in which the region uses the given face. Returns 1 if the face normal points out of the region and returns 0 if the face normal points into the region.

***int* MR_FaceDir_i(*MRegion_ptr* mregion, *int* i):** Returns the direction in which the region uses the i'th face. Returns 1 if the face normal points out of the region and returns 0 if the face normal points into the region.

***int* MR_UsesEntity(*MRegion_ptr* mregion, *MEntity_ptr* ment, *int* type):** Check if the region uses the given lower dimension entity, 'mentity'. The type of the entity is

***PType* MR_PType(*MRegion_ptr* v):** Parallel entity type for edge - can be PINTE-
RIOR, POVERLAP or PGHOST.

***int* MR_MasterParID(*MRegion_ptr* v):**

***int* MR_GlobalID(*MRegion_ptr* v):**

The following three functions affect how mesh entities communicate and how their attributes are updated. IF YOU DON'T KNOW WHAT YOU ARE DOING WHEN YOU CALL THIS FUNCTION, YOU WILL GET WHAT YOU DESERVE.

***void* MR_Set_PType(*MRegion_ptr* v, *PType* ptype):**

***void* MR_Set_MasterParID(*MRegion_ptr* v, *int* masterparid)**

***void* MR_Set_GlobalID(*MRegion_ptr* v, *int* globalid):**

***void* MR_Coords(*MRegion_ptr* mregion, *int* *n, *double* (*xyz)[3]):** Returns the coordinates of the region vertices in an array along with the number of vertices. For standard elements, the ordering is as given in Appendix A. For non-standard elements, the ordering is arbitrary.

4.7 Generic Entity Object

The following functions operate on generic mesh entities of type *MEntity_ptr*. This implies that variables of type *MVertex_ptr*, *MEdge_ptr*, *MFace_ptr*, *MRegion_ptr* can all be passed in place of *MEntity_ptr* variables in the following functions.

***int* MEnt_ID(*MEntity_ptr* entity):** Returns the ID of a generic entity.

***int* MEnt_Dim(*MEntity_ptr* entity):** Returns the topological dimension or type of generic entity.

***int* MEnt_OrigDim(*MEntity_ptr* entity):** Returns the original topological dimension or type of generic entity before it was temporarily deleted.

***int* MEnt_IsVolatile(*MEntity_ptr* entity):** Is the entity a temporary (volatile) entity in a reduced representation or an explicitly represented persistent entity. For example, this query will return 1 on any edge in a reduced representation.

***Mesh_ptr* MEnt_Mesh(*MEntity_ptr* entity):** Returns the mesh that the entity belongs to.

***int* MEnt_GEntDim(*MEntity_ptr* entity):** Returns the dimension of the geometric model entity that the entity is classified on.

***GEntity_ptr* MEnt_GEntity(*MEntity_ptr* entity):** Returns a pointer or handle to geometric model entity that the entity is classified on.

***void* MEnt_Delete(*MEntity_ptr* entity, *int* keep):** Delete a generic mesh entity. If **keep** is 0, the entity is removed from the mesh and all topological and geometric information embedded in the entity is destroyed. If **keep** is 1, the region is marked as deleted and removed from the mesh but the entity is not destroyed. Also, lower order entities in the mesh no longer point up to this entity.

***void* MEnt_Set_AttrVal(*MEntity_ptr* ent, *MAttrib_ptr* attrib, *int* ival, *double* lval, *void* *pval):** Set the value of an attribute for given mesh entity. Depending on the attribute type, different arguments of this function are relevant. If the attribute type is:

- **INT** – specify the integer value in **ival**,

- **DOUBLE** – specify the the real value in **rval**,
- **VECTOR** – specify a pointer to an array of doubles in **pval**³ - the number of doubles should equal the number components specified in the definition of the VECTOR attribute,
- **TENSOR** – specify a pointer to an array of doubles in **pval** - the number of doubles should equal the number of components specified in the definition of the TENSOR attribute,
- **POINTER** – specify the pointer value in **pval**.

void MEnt_Rem_AttVal(MEntity_ptr ent, MAttrib_ptr attrib: Clear the value of the given attribute from the entity.

int MEnt_Get_AttVal(MEntity_ptr ent, MAttrib_ptr int *ival, double *rval, double **pval): Get the value of an attribute from an entity. Depending on the attribute type, different arguments of this function are relevant. If the attribute type is:

- **INT** – **ival** contains the integer value,
- **DOUBLE** – **rval** contains the real value,
- **VECTOR** – **pval** contains a pointer to an array of doubles,
- **TENSOR** – **pval** contains a pointer to an array of doubles,
- **POINTER** – **pval** contains the pointer value.

void MEnt_Rem_AllAttVals(MEntity_ptr): Remove all attribute values attached to an entity.

³Remember to not free the array specified in **pval** without telling the attribute system because MSTK stores the pointer to the array directly and does not make a copy of the array.

4.8 Mesh Attributes

***MAtrib_ptr* MAttrib_New(*Mesh_ptr* mesh, *const char **att_name, *MAttType* att_type, *MType* entdim, *<int ncomponents>*):** Define a new mesh attribute. Along with the mesh to which this attribute is assigned (**mesh**) and the name of the attribute (**att_name**), the type of the attribute (**att_type**) must be specified as **INT**, **DOUBLE**, **VECTOR**, **TENSOR** or **POINTER**. Also, the dimension of the entity for which the attribute value can be set must be specified as **MVERTEX**, **MEDGE**, **MFACE**, **MREGION** or **MALLTYPE**. The last argument **ncomponents** is an optional argument for attributes of type **INT**, **DOUBLE** or **POINTER** but is required for attributes of type **VECTOR** and **TENSOR**.

***char **MAttrib_Get_Name(*MAtrib_ptr* attrib, *char **att_name):** Get the name of the given attribute.

***MAttType* MAttrib_Get_Type(*MAtrib_ptr* attrib):** Get the type of the attribute (Can return **INT**, **DOUBLE**, **PVAL**).

***MType* MAttrib_Get_EntDim(*MAtrib_ptr* attrib):** Get the dimension (or type) of entity attribute can be assigned to. Can be **MVERTEX**, **MEDGE**, **MFACE**, **MREGION** or **MALLTYPE**.

***void* MAttrib_Delete(*MAtrib_ptr* attrib):** Delete an attribute.

4.9 Mesh Sets

Mesh sets are unordered but named sets of entities. MSets can be queried and modified just like Lists. However, unlike Lists, MSets are associated with a mesh, can be constrained to contain only particular types of entities and have boolean operations performed on them.

***MSet_ptr* MSet_New(*Mesh_ptr* mesh, *const char* *set_name, *MType* entdim):**

Define a new mesh entity set. Along with the mesh to which this set is assigned (**mesh**) and the name of the set (**att_name**), the the dimension of the entities that the set can contain must be specified as **MVERTEX**, **MEDGE**, **MFACE**, **MREGION** or **MALLTYPE**.

***char* *MSet_Name(*MSet_ptr* set, *char* *att_name):** Get the name of the given set.

***MType* MSet_EntDim(*MSet_ptr* set):** Get the dimension of entities the set can contain. Can be **MVERTEX**, **MEDGE**, **MFACE**, **MREGION** or **MALLTYPE**.

***Mesh_ptr* MSet_Mesh(*MSet_ptr* set):** Returns the mesh that the entity set belongs to.

***void* MSet_Delete(*MSet_ptr* set):** Delete an set.

***MSet_ptr* MSet_Add(*MSet_ptr* l, *void* *entry):** Add an entry to the set. The entry is strictly appended to the end of the set.

***MSet_ptr* MSet_ChknAdd(*MSet_ptr* l, *void* *entry):** Add an entry to a set only if it is not already in the set.

***MSet_ptr* MSet_Insert(*MSet_ptr* l, *void* *numentry, *void* *b4entry):** Insert an entry into the set in the position before 'b4entry'.

***MSet_ptr* MSet_Inserti(*MSet_ptr* l, *void* *numentry, *int* i):** Insert an entry into the set at the i'th valid position and push the entries previously at the i'th and later position back.

***int* MSet_Rem(*MSet_ptr* l, *void* *entry):** Remove an entry from the set. Returns 1 if successful, 0 otherwise.

***int* MSet_Remi(*MSet_ptr* l, *int* i):** Remove the i'th valid entry in the set. Returns 1 if successful, 0 otherwise.

***int* MSet_Replace(*MSet_ptr* l, *void* *entry, *void* *numentry):** Replace 'entry' with 'numentry' in set. Returns 1 if successful, 0 otherwise.

***int* MSet_Replacei(*MSet_ptr* l, *int* i, *void* *numentry):** Replace the i'th valid entry in the set with 'numentry'. Returns 1 if successful, 0 otherwise.

***int* MSet_Contains(*MSet_ptr* l, *void* *entry):** Returns 1 if set contains the entry, 0 otherwise.

***int* MSet_Locate(*MSet_ptr* l, *void* *entry):** Returns the positional index of the entry in the set. Returns -1 if the set does not contain the entry.

***void* *MSet_Entry(*MSet_ptr* l, *int* i):** Return the i'th valid entry in the set. Returns a NULL pointer if the i'th valid entry could not be found.

***void* *MSet_Next_Entry(*MSet_ptr* l, *int* *i):** Return the next valid entry in the set. This routine works just like List_Next_Entry.

***int* MSet_Num_Entries(*MSet_ptr* l):** Return the number of entries in a set.

***MSet_ptr* MSets_Union(*MSet_ptr* s1, *MSet_ptr* s2):** Create a new set from the union of two sets.

***MSet_ptr* MSets_Intersect(*MSet_ptr* s1, *MSet_ptr* s2):** Create a new set from the intersection of two sets. Routine returns null if the intersection is a null set.

***MSet_ptr* MSets_Subtract(*MSet_ptr* s1, *MSet_ptr* s2):** Create a new set by subtracting set 2 from set 1. Routine returns null if the result is a null set.

4.10 Entity Marks

Entity marks or markers are a way of tagging entities. Such functionality is useful in algorithms which must keep track of processed entities to avoid duplication of work. An example of such an operation is creating a union of entity sets while extracting upward adjacency information such as the regions connected to an edge. Use of entity marks avoids calling **List_ChknAdd** (search through the list and add item if it is not there) or using attributes to tag entities with 0 or 1. As a result it is much more efficient than either option.

int MSTK_GetMarker(): Returns a unique marker ID which may be used to tag entities.

void MEnt_Mark(MEntity_ptr ent, int mkr): Mark an entity with the given marker 'mkr'.

int MEnt_IsMarked(MEntity_ptr ent, int mkr): Check if an entity is marked with the given marker 'mkr'.

void MEnt_Unmark(MEntity_ptr ent, int mkr): Unmark an entity with respect to the given marker 'mkr'.

void List_Mark(List_ptr list, int mkr): Mark a list of entities with given marker.

void List_Unmark(List_ptr list, int mkr): Unmark a list of entities with respect to the given marker.

void MSet_Mark(MSet_ptr list, int mkr): Mark a set of entities with given marker.

void MSet_Unmark(MSet_ptr list, int mkr): Unmark a set of entities with respect to the given marker.

void MSTK_FreeMarker(int mkr): Release the marker ID given by **MSTK_GetMarker()** so that it can be reused. Care must be taken to unmark all entities marked with this marker ID before releasing it. If not, subsequent operations with reassigned marker will find a tag on some entities and mistake them for being processed.

An example use of entity marks is given below:

```

/* Code to get the faces of a vertex */
/* NOTE: This code is for illustration of entity marks only. */
/*      This functionality is already available through MV_Faces */

vedges = MV_Edges(v);      /* Edges of vertex */

mkid = MSTK_GetMarker();    /* Get a new marker */
vfaces = List_New(10);      /* Initialize list of faces cnctd to v */

idx = 0;
while ((ve = List_Next_Entry(vedges,&idx))) { /* For each edge */

    efaces = ME_Faces(ve);      /* Get faces of edge */
    idx1 = 0;
    while ((ef = List_Next_Entry(efaces,&idx1))) {
        if (!MEnt_IsMarked(ef,mkid)) { /* Is the face already in list? */
            List_Add(vfaces,ef);      /* No? Add it to the list and */
            MEnt_Mark(ef,mkid);      /* mark it as being in the list */
        }
    }
    List_Delete(efaces);
}

List_Delete(vedges);

List_Unmark(vfaces,mkid);      /* Unmark all the marked faces */
MSTK_FreeMarker(mkid);        /* Very important to free the marker!! */
/* otherwise, we'll run out of markers */

```

4.11 Parallel Mesh Management

The following are the highest level of parallel mesh management functions.

int MSTK_Mesh_Read_Distribute(*Mesh_ptr* *recv_mesh, *const char** global_mesh_name, *int* *dim, *int* ring, *int* with_attr, *int* rank, *int* num, *MPI_Comm* comm):

Routine reads a mesh of dimension 'dim' from file 'global_mesh_name' on processor 'rank' and distributes it 'num' processors. 'comm' is the communicator to be used by MPI. If 'ring' is 0, there is no overlap of the highest level entities between processors - only entities on processor boundaries will be duplicated on other processors. If 'ring' is N, then 'N' layers of the highest level entities will overlap between processors (*Currently, only 1 layer of overlap elements are supported*). If 'with_attr' is 1, then MSTK sets up the links necessary to synchronize attribute data across processors. This routine must be called from only one processor.

int MSTK_Mesh_Distribute(*Mesh_ptr* *recv_mesh, *int* *dim, *int* ring, *int* with_attr, *int* rank, *int* num, *MPI_Comm* comm):

Similar to the above Read_Distribute routine except that it does not do any read. On the root processor, 'recv_mesh' is an input-output parameter - the application uses it to send in the full mesh to be distributed and the mesh partition belonging to the root processor is returned in it. On other processors, this is an output parameter only. Also, 'dim', indicating the topological dimension of the input mesh, is an input parameter on the root processor while it is an output parameter on the other processors.

int MSTK_UpdateAttr(*Mesh_ptr* mesh, *int* rank, *int* num, *MPI_Comm* comm):

Update the attributes of duplicated entities on remote processors.

For users requiring more fine grain control of their application, the following a list of lower level parallel mesh functions. Descriptions of these functions will be added soon. **NOTE THAT THESE ROUTINES HAVE NOT IN ANYWAY BEEN MADE IDIOT-PROOF AND REQUIRE GOOD KNOWLEDGE OF THE PARALLEL MODEL IN MSTK.**

int MSTK_SendMesh(*Mesh_ptr* mesh, *int* rank, *int* with_attr, *MPI_Comm* comm):

int MSTK_RecvMesh(*Mesh_ptr* mesh, *int* dim, *int* send_rank, *int* rank, *int* with_attr, *MPI_Comm* comm):

int MESH_PartitionWithMetis(*Mesh_ptr* mesh, *int* nparts, *int* **part):
int MSTK_Mesh_Partition(*Mesh_ptr* mesh, *Mesh_ptr* *submeshes, *int* num, *int* ring, *int* with_attr)
int MESH_Partition(*Mesh_ptr* mesh, *Mesh_ptr* *submeshes, *int* num)
int MESH_CopyAttr(*Mesh_ptr* mesh, *Mesh_ptr* submesh, *const char* *attr_name)
int MESH_BuildPBoundary(*Mesh_ptr* mesh, *Mesh_ptr* submesh)
int MESH_AddGhost(*Mesh_ptr* mesh, *Mesh_ptr* submesh, *int* part_no, *int* ring)
int MESH_SendMesh(*Mesh_ptr* mesh, *int* rank, *MPI_Comm* comm)
int MESH_SendAttr(*Mesh_ptr* mesh, *const char* *attr_name, *int* rank, *MPI_Comm* comm)
int MESH_RecvMesh(*Mesh_ptr* mesh, *int* dim, *int* send_rank, *int* rank, *MPI_Comm* comm)
int MESH_RecvAttr(*Mesh_ptr* mesh, *const char* *attr_name, *int* rank, *int* recv_rank, *MPI_Comm* comm)
int MESH_Num_GhostVertices(*Mesh_ptr* mesh): Number of ghost vertices in the mesh.
int MESH_Num_GhostEdges(*Mesh_ptr* mesh): Number of ghost edges in the mesh.
int MESH_Num_GhostFaces(*Mesh_ptr* mesh): Number of ghost faces in the mesh.
int MESH_Num_GhostRegions(*Mesh_ptr* mesh): Number of ghost regions in the mesh.

MVertex_ptr MESH_GhostVertex(*Mesh_ptr* mesh, *int* i): Return the i'th ghost vertex in the mesh. Returns NULL if i < 0 or i > number of mesh vertices.

MEdge_ptr MESH_GhostEdge(*Mesh_ptr* mesh, *int* i): Return the i'th ghost edge in the mesh. Returns NULL if i < 0 or i > number of mesh edges. Returns NULL for reduced representations.

***MFace_ptr* MESH_GhostFace(*Mesh_ptr* mesh, *int* i):** Return the i'th face in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh faces}$. Only faces explicitly represented in the mesh are returned for reduced representation.

***MRegion_ptr* MESH_GhostRegion(*Mesh_ptr* mesh, *int* i):** Return the i'th region in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh region}$.

***MVertex_ptr* MESH_Next_GhostVertex(*Mesh_ptr* mesh, *int* *idx):** Returns the next ghost vertex while iterating through the vertices of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. This routine is in general faster than using the routine **MESH_GhostVertex**.

***MEdge_ptr* MESH_Next_GhostEdge(*Mesh_ptr* mesh, *int* *idx):** Returns the next ghost edge while iterating through the edges of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. The routine always returns NULL for reduced representations.

***MFace_ptr* MESH_Next_GhostFace(*Mesh_ptr* mesh, *int* *idx):** Returns the next ghost face while iterating through the faces of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. Only faces explicitly represented in the mesh are returned for reduced representation.

***MRegion_ptr* MESH_Next_GhostRegion(*Mesh_ptr* mesh, *int* *idx):** Returns the next region while iterating through the regions of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works.

***int* MESH_Num_OverlapVertices(*Mesh_ptr* mesh):** Number of overlap vertices in the mesh.

***int* MESH_Num_OverlapEdges(*Mesh_ptr* mesh):** Number of overlap edges in the mesh.

***int* MESH_Num_OverlapFaces(*Mesh_ptr* mesh):** Number of overlap faces in the mesh.

***int* MESH_Num_OverlapRegions(*Mesh_ptr* mesh):** Number of overlap regions in the mesh.

***MVertex_ptr* MESH_OverlapVertex(*Mesh_ptr* mesh, *int* i):** Return the i'th overlap vertex in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh vertices}$.

***MEdge_ptr* MESH_OverlapEdge(*Mesh_ptr* mesh, *int* i):** Return the i'th overlap edge in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh edges}$. Returns NULL for reduced representations.

***MFace_ptr* MESH_OverlapFace(*Mesh_ptr* mesh, *int* i):** Return the i'th face in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh faces}$. Only faces explicitly represented in the mesh are returned for reduced representation.

***MRegion_ptr* MESH_OverlapRegion(*Mesh_ptr* mesh, *int* i):** Return the i'th region in the mesh. Returns NULL if $i < 0$ or $i > \text{number of mesh region}$.

***MVertex_ptr* MESH_Next_OverlapVertex(*Mesh_ptr* mesh, *int* *idx):** Returns the next overlap vertex while iterating through the vertices of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. This routine is in general faster than using the routine **MESH_OverlapVertex**.

***MEdge_ptr* MESH_Next_OverlapEdge(*Mesh_ptr* mesh, *int* *idx):** Returns the next overlap edge while iterating through the edges of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. The routine always returns NULL for reduced representations.

***MFace_ptr* MESH_Next_OverlapFace(*Mesh_ptr* mesh, *int* *idx):** Returns the next overlap face while iterating through the faces of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works. Only faces explicitly represented in the mesh are returned for reduced representation.

***MRegion_ptr* MESH_Next_OverlapRegion(*Mesh_ptr* mesh, *int* *idx):** Returns the next region while iterating through the regions of the mesh. See the routine **List_Next_Entry** above for an explanation of how the iteration works.

4.12 Mesh Modification

int ME_Swap2D(*MEdge_ptr* e, *MEdge_ptr* *enew, *MFace_ptr* fnew[2]): Swap an edge in a triangular mesh. No checks are performed for topological or geometric validity.

MVertex_ptr MVs_Merge(*MVertex_ptr* v1, *MVertex_ptr* v2): Merge two vertices, v1 and v2, and return the retained vertex. By default, v1 is retained.

MFace_ptr MFs_Join(*MFace_ptr* f1, *MFace_ptr* f2, *MEdge_ptr* e): Join two faces along common edge and create new face by eliminating the common edge as shown in Figure 4. If 'f1' has 'n1' edges and 'f2' has 'n2' edges, then the new face has ('n1'+ 'n2'- 2) edges.

Figure 4: Joining two faces (a) Two faces F_1 and F_2 sharing a common edge (b) New pentagonal face F_{new} created by eliminating the common edge.

4.13 Utilities

***void* MSTK_Report(*char* *module, *char* *message, *ErrType* severity):** Error handler for MSTK. 'module' is the name of the function in which the error occurs. 'message' is the error message and is recommended to be less than 1024 characters in length. 'severity' is an error code and can be MESSG, WARN, ERROR or FATAL. If the error code is FATAL, the program will quit after printing the error. If the same message is repeated successively, then the message is printed only the first time.

***void* List_PrintID(*List_ptr* l):** Debugging utility to print the IDs of the entities in a set.

***void* MV_Print(*MVertex_ptr* v, *int* lev):** Debugging utility to print information about a mesh vertex, *v*. The argument *lev* controls the level of detail of the information printed. *lev* = 0 prints the minimum information, i.e., vertex pointer, its ID and its coordinates. If *lev* = 1, the function prints classification information for the vertex (if available), i.e., ID and dimension of the model entity that the vertex is on. If *lev* > 1, then upward detailed adjacency information is also printed for the vertex, i.e., information is printed about the edges, faces and regions connected to the vertex.

***void* ME_Print(*MEdge_ptr* e, *int* lev):** Debugging utility to print information about a mesh edge, *e*. The argument *lev* controls the level of detail of the information printed. *lev* = 0 prints the minimum information, i.e., edge pointer, its ID and the IDs of its two vertices. If *lev* = 1, the function prints classification information for the edge (if available), i.e., ID and dimension of the model entity that the edge is on. Also, more detailed vertex information printed in this case. If *lev* > 1, the function prints detailed upward adjacency information for the edge, i.e., information is printed about the faces and regions connected to the edge.

***void* MF_Print(*MFace_ptr* f, *int* lev):** Debugging utility to print information about a mesh face, *f*. The argument *lev* controls the level of detail of the information printed. *lev* = 0 prints the minimum information, i.e., the face pointer and its ID. If *lev* = 1, the function prints classification information for the edge (if available), i.e., ID and dimension of the model entity that the face is on. Also, a signed list of the edges of the face is printed. If *lev* > 1, the function prints detailed downward and upward adjacency information for the face, i.e., information is printed about the edges and vertices of the face, and about the regions connected to the face.

***void* MR_Print(*MRegion_ptr* r, *int* lev):** Debugging utility to print information about a mesh region, *r*. The argument *lev* controls the level of detail of the information

printed. **lev** = 0 prints the minimum information, i.e., region pointer and its ID. If **lev** = 1, the function prints classification information for the region (if available), i.e., ID of the model entity that the region is on. Also, a signed list of the faces of the region is printed. If **lev** > 1, the function prints detailed downward adjacency information for the region, i.e., information is printed about the faces, edges and vertices forming the region.

C Example Mesh and Files

In this section we show a simple square geometric model and an example 2D mesh of that model comprised of triangles, quads (convex and non-convex) and polygons. Assume that the mesh vertices have a velocity associated with them and mesh faces have a symmetric second-order diffusivity tensor associated with them. We then present the MSTK files describing the mesh in the F1 and R1 formats.

Figure 5: Geometric model and a two-dimensional mesh of mixed elements of the model.

File in F1 format:
